

Car Rental Database EER Diagram

Homework 2.1 EER Diagram

Isaac Harris
Aryan Kafley

$f(\text{RentalLen}) = (\text{Due_Date} - \text{Startdate})$
On return it is changed to $f(\text{RentalLen}) = (\text{Return_Date} - \text{Start Date})$

$f(\text{Total_Rental_Cost}) = (\text{RentalLen} * \text{Rental_rates.Weekly_Rate}) / 7$
Or for daily
 $f(\text{Total_Rental_Cost}) = (\text{RentalLen} * \text{Rental_rates.Dailyy_Rate})$

Cars.Is_Available is updated when the car is booked or when the care is returned.

transactions.Is_Returned is updated when the tranaction is started to 'N' then updated to 'Y' on the return.

Return_Date is not imputed by the users cars can only be returned on the current day.

Trans_Start is not imputed by the users it us updated automatically at the start of a transaction.

The subset AVAILABLE_CARS is formed using a Boolean condition based on the variable cars.Is_Available where cars.Is_Available = 'Y'

A CUSTOMER can rent as many AVAILABLE_CARS as they would like at any given time.

A TRANSACTIONS can only have one of each attribute.

A CARS can be on any number of TRANSACTIONS.

A CUSTOMER can have any number of TRANSACTIONS.

Num_Seats, Has_AWD, Has_Truck_Bed are used to determine the type of car that is being rented.

$\text{dom}(\text{TRANSACTIONS.Vehicle_ID}) = \text{dom}(\text{CARS.Vehicle_ID})$

$\text{dom}(\text{TRANSACTIONS.ID_Num}) = \text{dom}(\text{CUSTOMER.ID_Num})$

$\text{dom}(\text{TRANSACTIONS.Rate_ID}) = \text{dom}(\text{RENTAL_RATES.Rate_ID})$

A TRANSACTIN can only be started with a valid customer.ID, AVLALIBLE_CARS.Vehicle_ID, Rate_ID,

Start_Date, and Due_Date.
